

SUSTAINABILITY REPORTING

Sustainability is the way forward to build an effective and lasting business model.

An organization's commitment to developing its products and services sustainably needs to be communicated transparently and effectively to all the interested parties.

SUSTAINABILITY REPORTING is a method of non-financial reporting for communicating the impacts of an organization to its stakeholders, promoting the sustainability practices adopted and gathering the confidence of the interested parties.

GRI (GLOBAL REPORTING INITIATIVE) is the most recognized standard used for publishing a sustainability report.

The GRI standard together with the **GHG PROTOCOL** to calculate the carbon emissions is an efficient and versatile tool for an Organization to understand, measure and communicate its impacts transparently and responsibly on various aspects of sustainability: **ECONOMIC, ENVIRONMENTAL AND SOCIAL.**
